Assumptions: One light per upper unit; 2 lights per lower units, town homes and end bungalows (Front and Back or Side lights). 3 bdr units treated as two lights per unit.

* Formula for determining (estimating) total # of Lights per Bldg: Total # Units, less # upper units = # of lower units and town homes. Lower units x 2, + # of upper units + any porch lights from 3 bdr units = Total number of lights. Then, it's OK to take the percentage.
